07/12/2007

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/700,338	Applicant(s) CIRNE ET AL.	
	Examiner Zheng Wei	Art Unit 2192	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 23 April 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-3, 5-15, 17-24, 26-35, 37-42 and 44-50 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-3, 5-15, 17-24, 26-35, 37-42 and 44-50 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 03 November 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Remarks

1. This office action is in response to the amendment filed on 04/23/2007.
2. Claims 4, 16, 25, 36 and 43 have been canceled.
3. Claims 1-3, 5, 6, 13-15, 17, 18, 22-24, 26, 27, 33-35, and 37-42 have been amended.
4. Claims 47-50 have been added
5. The 35 U.S.C. 112 second paragraph rejection of claims 1-39 are withdrawn in view of the Applicant's amendment.
6. The objection to claims 15, 38 and 43 is withdrawn in view of the Applicant's amendment of claims 15, 38 and cancellation of claim 43.
7. Claims 1-3, 5-15, 17-24, 26-35, 37-42, and 44-50 remain pending and have been examined.

Response to Arguments

8. Applicant's arguments filed on 04/23/2007, in particular on pages 12-13, has been fully considered but they are not persuasive. For example:
 - At page 12, first and third paragraphs, Applicants contend that Claim 1 is not anticipated by Berkley, as Berkley does not disclose "determining whether to modify said method, said step of determining whether to modify said method includes determining whether said method calls another method" which

Examiner disagrees. As to previous Office action, paper number 4, examiner pointed out at Fig.1, function calls between "method B", "Method C" and its related description at col.1, lines 48- col.2, lines 6. The Examiner also pointed out at col2., lines 39-40, "means for determining whether the function (method) is active for a class" that Berkley, indeed discloses a step whether said method calls another method. Therefore, the examiner reasserted that Berkley, indeed, anticipated the claimed limitations as set forth in the previous Office Action;

- At page 12, section IV and page 13 section V, Applicants assert that claims 2-6, 9, 11, 14-19, 21-38, 40 and 44-46 are in condition for allowance. Because Claim 1 does not disclose "determining whether to modify said method , said step of determining whether to modify said method calls another method". As to response above, the rejection of the claims over prior arts is maintained in view of Berkley's disclosure and further in view of Berry.

Claim Rejections - 35 USC § 102

9. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent

Art Unit: 2192

granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

10. Claims 1, 7, 8, 10, 12, 13, 20 and 39 are rejected under 35 U.S.C. 102(e) as being anticipated by Berkley (Berkley et al., US 6351843 B1).

Claim 1:

Berkley discloses a process for monitoring, comprising:

- accessing a method (see for example Fig.5, step 350 and related text, also see, col.2, lines 36-37, "Further, the system includes means for running the application executable using the modified runtime configuration settings");
- determining whether to modify said method, said step of determining whether to modify said method includes determining whether said method calls another method (see for example, Fig.1 and related text, "METHOD B", "METHOD C" and also see col.2, lines 39-40, "means for determining whether the function (method) is active for a class of the executable using the modified configuration settings"); and
- modifying said method for a particular purpose if said method calls another method. (see for example, col.2, lines 41-43, "means for dynamically creating a redirection stub to insert the function for the class if the function is active for that class")

Claim 7:

Berkley further discloses a process according to claim 1, wherein: said step of modifying includes modifying object code (see for example, col.2, lines 45-46, "inserting a function into an application executable without recompiling the executable.")

Claim 8:

Berkley also discloses a process according to claim 1, wherein: said step of modifying includes adding a tracer for said method (see for example, Fig.5, step 360 and related text, also see, col.3, lines 6-8, "To restate, a technique is presented for dynamically modifying class lineage in order to insert a function, such as a trace function...").

Claim 10:

Berkley further discloses a process according to claim 1, wherein: said step of modifying includes adding exit code and start code to existing object code (see for example, Fig.6, step 460 and related text, "Create redirection stubs that will call trace entry and ext method around target method").

Claim 12:

Berkley also discloses a process according to claim 1, wherein: said particular purpose is to add a first tracer (see for example, Fig.5, step 360 and related text, also see, col.3, lines 6-8, "To restate, a technique is presented for dynamically

modifying class lineage in order to insert a function, such as a trace function...").

Claim 13:

Berkley discloses a process for monitoring, comprising:

- determining which methods of a set of methods call one or more other methods (see for example, Fig.1 and related text, "METHOD B", "METHOD C" and also see col.2, lines 39-40, "means for determining whether the function (method) is active for a class of the executable using the modified configuration settings"); and
- using a first tracing mechanism for said methods determined to call one or more other methods without using said first tracing mechanism for methods not determined to call one or more other methods (see for example, col.2, lines 41-43, "means for dynamically creating a redirection stub to insert the function for the class if the function is active for that class", also see Fig.5, step 360 and related text, also see, col.3, lines 6-8, "To restate, a technique is presented for dynamically modifying class lineage in order to insert a function, such as a trace function...").

Claim 20:

Berkley further discloses a process according to claim 13, wherein: said step of using a first tracing mechanism includes modifying existing object code to add said first tracing mechanism (see for example, Fig.5, step 360 and related text,

also see, col.3, lines 6-8, "To restate, a technique is presented for dynamically modifying class lineage in order to insert a function, such as a trace function...").

Claim 39:

Berkley discloses an apparatus capable of monitoring, comprising:

- means for determining whether a method is call another method (see for example, Fig.1 and related text, "METHOD B", "METHOD C" and also see col.2, lines 39-40, "means for determining whether the function (method) is active for a class of the executable using the modified configuration settings"); and
- means for tracing said method for a particular purpose only if said method calls another method (see for example, col.2, lines 41-43, "means for dynamically creating a redirection stub to insert the function for the class if the function is active for that class", also see Fig.5, step 360 and related text, also see, col.3, lines 6-8, "To restate, a technique is presented for dynamically modifying class lineage in order to insert a function, such as a trace function...").

Claim Rejections - 35 USC § 103

11. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Art Unit: 2192

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

12. Claims 2, 3, 5, 6, 14, 15, 17, 18, 40-42, 44 and 47-50 are rejected under 35

U.S.C. 103(a) as being unpatentable over Berkley (Berkley et al., US 6351843 B1)

Claims 2 and 14:

Berkley discloses processes according to claims 1 and 13 above respectively, but does not explicitly disclose said step of determining whether to modify said method includes determining whether said method is non-synthetic. However, It is well known in the Java programming that all synthetic methods generated by Java compiler are flagged in the class file and thus are easily identified (A well known and widely used Java programming standard: Java Virtual Machine Specification). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to determine whether said method is non-synthetic by checking the synthetic attribute field in bytecode while being compiled by JIT, Hotspot runtime or other bytecode scanning tools. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing application executable", "allows a user to specify one or more methods for which the function is to be implemented")

Claims 3 and 15:

Berkley discloses processes according to claim 1 and 13 above respectively, but does not explicitly disclose said step of determining whether to modify aid method includes determining whether said method has an access level of public or package. However, it is well known in the Java programming that JVM specification (see for example, A well known and widely used Java Virtual Machine Specification) defines a set of access flags in method_info structure which has a flag name "ACC_PUBLIC" for access level of public or package. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to determine whether said method has an access level of public or package by using JIT, Hotspot runtime or other bytecode scanning tools to check this flag to determining whether said method has an access level of public or package. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing application executable", "allows a user to specify one or more methods for which the function is to be implemented")

Claims 5 and 17:

Berkley discloses processes according to claim 1 and 13 above respectively, but does not disclose said step of determining whether to modify said method includes determining whether said method is non-synthetic, calls another method and has an access level of public or package. However, according to the rejection for the claims 2, 3, 4 and 14, 15 above, it would have been obvious to one having ordinary skill in the art at the time the invention was made to combine those steps together to further focus on tracing specify one or more methods for which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing application executable", "allows a user to specify one or more methods for which the function is to be implemented")

Claims 6 and 18:

Berkley discloses processes according to claim 1 and 13 above respectively, but does not disclose said step of determining whether to modify said method includes determining whether said method calls one or more different methods and can be called by a sufficient scope of one or more other methods. However, it is well known in the Java programming that JVM specification (see for example, A well known and widely used Java Virtual Machine Specification) defines method by using a block starting with the tag "Method" that contains the information about calling other methods in java bytecode. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention

was made to determine whether said method calls another method and can be called by a sufficient scope of one or more other methods by checking the method information in that block while running by JIT in JVM or other bytecode scanning tools. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing application executable", "allows a user to specify one or more methods for which the function is to be implemented")

Claim 40:

Berkley discloses an apparatus capable of monitoring, comprising:

- a storage device (see for example, Fig.3, items 102, 103 "Main Storage", "External Storage Media" and related text); and
- one or more processors in communication with said storage device (see for example, Fig.3, item 104, "CPU 1...CPU N" and related text), said one or more processors perform a process comprising:
 - accessing a method (see for example Fig.5, step 350 and related text, also see, col.2, lines 36-37, "Further, the system includes means for running the application executable using the modified runtime configuration settings");
 - tracing said method for a particular purpose if said method calls one or more different methods and can be called by a sufficient scope of one or more other methods (see for example, col.2, lines 41-43, "means for dynamically

creating a redirection stub to insert the function for the class if the function is active for that class”, also see Fig.5, step 360 and related text, also see, col.3, lines 6-8, “To restate, a technique is presented for dynamically modifying class lineage in order to insert a function, such as a trace function...”).

But Berkley does not disclose:

- determining whether said method calls one or more different methods and can be called by a sufficient scope of one or more other methods.

However, it is well known in the Java programming that JVM (Java Virtual Machine) specification defines method by using a block starting with the tag “Method” that contains the information about calling other methods in java bytecode. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to determine whether said method calls another method and can be called by a sufficient scope of one or more other methods by checking the method information in that block while running by JIT in JVM or other bytecode scanning tools. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, “dynamically inserting a function into an existing application executable”, “allows a user to specify one or more methods for which the function is to be implemented”)

Claim 41:

Berkley discloses an apparatus according to claim 40, but does not explicitly disclose said step of determining whether to modify said method includes determining whether said method is non-synthetic. However, It is well known in the Java programming that all synthetic methods generated by Java compiler are flagged in the class file and thus are easily identified (see for example, A well known and widely used Java Virtual Machine Specification). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to determine whether said method is non-synthetic by checking the synthetic attribute field in bytecode while being compiled by JIT, Hotspot runtime or other bytecode scanning tools. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing application executable", "allows a user to specify one or more methods for which the function is to be implemented")

Claim 42:

Berkley further discloses an apparatus according to claim 40, but does not explicitly disclose said step of determining whether to modify aid method includes determining whether said method has an access level of public or package. However, it is well known in the Java programming that JVM specification (see for example, A well known and widely used Java Virtual Machine Specification)

Art Unit: 2192

defines a set of access flags in method_info structure which has a flag name "ACC_PUBLIC" for access level of public or package. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to determine whether said method has an access level of public or package by using JIT, Hotspot runtime or other bytecode scanning tools to check this flag to determining whether said method has an access level of public or package. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing application executable", "allows a user to specify one or more methods for which the function is to be implemented")

Claim 44:

Berkley discloses an apparatus according to claim 40 and further discloses said process further includes modifying existing object code for said method in order to add a first tracing mechanism (see for example, col.2, lines 45-46, "inserting a function into an application executable without recompiling the executable.")

Claims 47-50:

Claims 47-50 is another version process for monitoring as in claims 1-3, 5 and 8 addressed above, wherein all claimed limitation functions have been addressed and/or set forth above. Therefore, they also would have been obvious.

13. Claims 9, 11, 19, 21-24, 26-35, 37, 38, 45 and 46 are rejected under 35 U.S.C. 103(a) as being unpatentable over Berkley (Berkley et al., US 6,351,843) in view of Berry (Berkley et al., US 6,662,359).

Claim 9:

Berkley discloses a process according to claim 1, but does not explicitly disclose said step of modifying includes adding a timer for said method. However, Berry in the same analogous art of system and method for injecting hooks into java classes to handle exception and finalization processing discloses using timestamp (see for example, col.14, lines 1-19, column 3 in the example table, "timestamp" and related text"). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to use timestamp as a way to trace specified application executable. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing application executable", "allows a user to specify one or more methods for which the function is to be implemented")

Claim 11:

Berkley discloses a process according to claim 10, wherein:

Art Unit: 2192

- said start code starts a tracing process (see for example, Fig.6, step 460 and related text, "Create redirection stubs that will call trace entry and ext method around target method");
- said exit code stops said tracing process (see for example, Fig.6, step 460 and related text, "Create redirection stubs that will call trace entry and ext method around target method");
- said exit code is positioned to be executed subsequent to original object code (see for example, Fig.6, step 470 and related text, "Remaining class construction flows");

But Berkley does not disclose said steps of adding exit code including jump instruction, exception table and said step of adding an entry in said exception table. However, Berry in the same analogous art of system and method for injecting hooks into java classes to handle exception and finalization processing discloses:

- said step of adding exit code includes adding an instruction to jump to said exit code from said original object code (see for example. Fig.8 steps 812-816 and related text, also see col.9, line 55- col.10, line 8,"a jump around inserted code");
- said step of adding exit code includes adding an entry in an exception table; and (see for example. Fig.8 step 802 and related text "Modify the exception table");

Art Unit: 2192

- said step of adding an entry in said exceptions table includes adding a new entry into said exceptions table for said method, said new entry indicates a range of indices corresponding to said original object code, said new entry includes a reference to said exit code and said new entry indicates that said new entry pertains to all types of exceptions (see for example, Fig.8 steps 812-816 and related text, also see col.9, line 55- col.10, line 8, "a jump around inserted code");

Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to add jump instruction and maintain exception table for inserting function into an application executable at runtime. One Would have been motivated to integrated Berry's steps into Berkley's process to ensure that code which moved due to either insertions or deletions is correctly relocated and related references are adjusted as pointed out by Berry (See for example, Col.9, lines 55-58, "to ensure that code which is moved due to either insertions or deletions is correctly relocated and related references are adjusted")

Claim 19:

Berkley discloses a process according to claim 13, but does not explicitly disclose said step of modifying includes adding a timer for said method.

However, Berry in the same analogous art of system and method for injecting hooks into java classes to handle exception and finalization processing discloses

using timestamp (see for example, col.14, lines 1-19, column 3 in the example table, "timestamp" and related text"). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to use timestamp as a way to trace specified application executable. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing application executable", "allows a user to specify one or more methods for which the function is to be implemented")

Claim 21:

Berkley discloses a process according to claim 20, but does not explicitly disclose said step of modifying includes adding a timer for said method.

However, Berry in the same analogous art of system and method for injecting hooks into java classes to handle exception and finalization processing discloses using timestamp (see for example, col.14, lines 1-19, column 3 in the example table, "timestamp" and related text"). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to use timestamp as a way to trace specified application executable. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing

application executable”, “allows a user to specify one or more methods for which the function is to be implemented”)

Claims 22-24 and 26-32:

Claims 22-24 and 26-32 claim one or more processor readable storage devices having processor readable code embodied on said processor readable storage devices, which is the product version of the process claims as discussed in claims 1-3 and 5-11 above respectively. Therefore, these claims are obvious over Berkley and Berry, because it is well known in the computer art to practice and/or produce such a program product for carrying out the acts/steps of such process by a typical computer processor.

Claims 33-35, 37 and 38:

Claims 33-35, 37 and 38 claim one or more processor readable storage devices having processor readable code embodied on said processor readable storage devices, said processor readable code for programming one or more processors to perform a process as discussed in claims 13-15, 17 and 19 above respectively. Therefore, these claims are obvious over Berkley and Berry, because it is well known in the computer art to practice and/or produce such a program product for carrying out the acts/steps of such process by a typical computer processor.

Claim 45:

Berkley discloses an apparatus according to claim 44 above, but does not disclose said first tracing mechanism includes a timer. However, Berry in the same analogous art of system and method for injecting hooks into java classes to handle exception and finalization processing discloses using timestamp (see for example, col.14, lines 1-19, column 3 in the example table, "timestamp" and related text"). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to use timestamp as a way to trace specified application executable. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing application executable", "allows a user to specify one or more methods for which the function is to be implemented").

Claim 46:

Berkley discloses an apparatus according to claim 44 above, but does not disclose said step of tracing includes timing said method. However, Berry in the same analogous art of system and method for injecting hooks into java classes to handle exception and finalization processing discloses using timestamp (see for example, col.14, lines 1-19, column 3 in the example table, "timestamp" and

related text"). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to use timestamp as a way to trace specified application executable. One would have been motivated to do so to allow a user to trace specified one or more methods of which the function is to be implemented as suggested by Berkley (see for example, col.2, lines 7-14, "dynamically inserting a function into an existing application executable", "allows a user to specify one or more methods for which the function is to be implemented").

Conclusion

14. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
15. Applicant's arguments with respect to claims rejection have been considered but are moot in view of the new grounds of rejection.

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory

Art Unit: 2192

action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

16. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Zheng Wei whose telephone number is (571) 270-1059 and Fax number is (571) 270-02059. The examiner can normally be reached on Monday-Thursday 8:00-15:00.
